5 TECHNICAL FIELD

The present invention relates to a cyclic tetrapeptide compound which is useful as a medicament, to a process for producing the same and to a pharmaceutical composition comprising the same.

10 BACKGROUND ART

Histone deacetylases are known to play an essential role in the transcriptional machinery for regulating gene expression, and histone deacetylase inhibitors induce histone hyperacetylation and affect the gene expression. Therefore, a histone deacetylase inhibitor is useful
15 as a therapeutic or prophylactic agent for diseases caused by abnormal gene expression, such as inflammatory disorders, diabetes, diabetic complications, homozygous thalassemia, fibrosis, cirrhosis, acute promyelocytic leukaemia (APL), protozoal infection, and the like.

In this connection, JP-A-7-196686 discloses a cyclic

Accordingly, one object of the present invention is to provide
5 a compound which has biological activities as stated above.

A further object of the present invention is to provide a pharmaceutical composition containing, as an active ingredient, the cyclic tetrapeptide compound [I].

A yet further object of the present invention is to provide a
10 use of the histone deacetylase inhibitors, such as cyclic tetrapeptide compound [I], for treating and preventing diseases as stated above.

A yet further object of the present invention is to provide a commercial package comprising the pharmaceutical composition containing the cyclic tetrapeptide compound [I] and a written matter
15 associated therewith, the written matter stating that the pharmaceutical composition may or should be used for treating or preventing diseases as stated above.

Thus, the present invention provides a cyclic tetrapeptide compound of the formula (I):

30 Test Method

In order to show the usefulness of the compound [I] of the invention, the pharmacological test result of the representative compounds of the present invention is shown in the following.

Test 1: Determination of histone deacetylase inhibitor activity

35 The partial purification of human histone deacetylase, the preparation of [3H] acetyl histones, and the assay for histone

deacetylase activity were performed basically according to the method as proposed by Yoshida et al. as follows.

Partial purification of human histone deacetylase

The human histone deacetylase was partially purified from human
5 T cell leukemia Jurkat cells. Jurkat cells (5×10^8 cells) were
suspended in 40 ml of the HDA buffer consisting of 15 mM potassium
phosphate, pH 7.5, 5% glycerol and 0.2 mM EDTA. After homogenization,
nuclei were collected by centrifugation ($35,000 \times g$, 10 min) and
homogenized in 20 ml of the same buffer supplemented with 1 M $(\text{NH}_4)_2\text{SO}_4$.
10 The viscous homogenate was sonicated and clarified by centrifugation
($35,000 \times g$, 10 min), and the deacetylase was precipitated by raising
the concentration of $(\text{NH}_4)_2\text{SO}_4$ to 3.5 M. The precipitated protein was
dissolved in 10 ml of the HDA buffer and dialyzed against 4 liters of
the same buffer. The dialyzate was then loaded onto a DEAE-cellulose
15 (Whatman DE52) column (25 x 85 mm) equilibrated with the same buffer
and eluted with 300 ml of a linear gradient (0-0.6 M) of NaCl. A
single peak of histone deacetylase activity appeared between 0.3 and
0.4 M NaCl.

Preparation of [^3H] acetyl histone

20 To obtain [^3H] acetyl-labeled histone as the substrate for the
histone deacetylase assay, 1×10^8 cells of Jurkat in 20 ml of RPMI-
1640 medium (supplemented with 10% FBS, penicillin (50 units/ml) and
streptomycin (50 $\mu\text{g}/\text{ml}$)) were incubated with 300 MBq [^3H] sodium
acetate in the presence of 5 mM sodium butyrate for 30 minutes in 5%
25 CO_2 -95% air atmosphere at 37°C in a 75 cm^2 flask, harvested into a
centrifuge tube (50 ml), collected by centrifugation at 1000 rpm for
10 minutes, and washed once with phosphate-buffered saline. The
washed cells were suspended in 15 ml of ice-cold lysis buffer (10 mM
Tris-HCl, 50 mM sodium bisulfite, 1% Triton X-100, 10 mM MgCl_2 , 8.6%
30 sucrose, pH 6.5). After Dounce homogenization (30 stroke), the nuclei
were collected by centrifugation at 1000 rpm for 10 minutes, washed 3
times with 15 ml of the lysis buffer, and once with 15 ml of ice-
cooled washing buffer (10 mM Tris-HCl, 13 mM EDTA, pH 7.4)
successively. The pellet was suspended in 6 ml of ice-cooled water
35 using a mixer, and 68 μl of H_2SO_4 was added to the suspension to give a
concentration of 0.4 N. After incubation at 4°C for 1 hour, the

suspension was centrifuged for 5 minutes at 15,000 rpm, and the supernatant was taken and mixed with 60 ml of acetone. After overnight incubation at -20°C, the coagulated material was collected by microcentrifugation, air-dried, and stored at -80°C.

5 Assay for histone deacetylase activity

For the standard assay, 10 µl of [³H] acetyl-labeled histones were added to 90 µl of the enzyme fraction, and the mixture was incubated at 25°C for 30 minutes. The reaction was stopped by addition of 10 µl of HCl. The released [³H] acetic acid was extracted with 1 ml of ethyl acetate, and 0.9 ml of the solvent layer was taken into 10 ml of toluene scintillation solution for determination of radioactivity.

Test 2: Determination of T-cell growth inhibitor activity

The T lymphocyte blastogenesis test was performed in microtiter plates with each well containing 1.5×10^5 splenic cells of Lewis rats in 0.1 ml RPMI-1640 medium supplemented with 10% fetal bovine serum (FBS), 50 mM 2-mercaptoethanol, penicillin (100 units/ml) and streptomycin (100 µg/ml), to which Concanavalin A (1 µg/ml) was added. The cells were incubated at 37°C in a humidified atmosphere of 5% CO₂ for 72 hours. After the culture period, suppressive activities of the test compounds in T lymphocyte blastogenesis were quantified by AlamarBlue (trademark) Assay. The test samples were dissolved in DMSO and further diluted with RPMI-1640 medium and added to the culture. The activities of the test compounds were expressed as IC₅₀.

25 The results of those tests are shown in the Table 1.

Test 3: Effect of HDAC inhibitor on TNF α induced NF- κ B activation

5 8.75 x 10⁶ HEL cells (JCRB0062, JCRB) were transfected with 10
 10 μ g of pNF κ B-TA-Luc (Clontech, as shown in Fig.1) by electroporation at
 1750 V and 10 μ F with Gene Pulser II (BIO-RAD). The cells were
 resuspended in 2 ml of RPMI1640 (SIGMA) supplemented with 10% FBS
 (MOREGATE) and aliquated 50 μ l each well in 96-well tissue culture
 15 plates. After 5 hr culture at 37°C, 5% CO₂, for cell function recovery,
 the cells were cultured in the presence or absence of TNF α (10 ng/ml)
 for 4 hr. TNF α stimulated cells were incubated with Compound E138 or
 FK506 (commercial available immunosuppressive agent, also referred as
 Tacrolimus) at appropriate concentrations for 1 hour prior to
 stimulation.

For the NF- κ B reporter gene assay, the transfected cells were
 lysed and assayed for luciferase activity with the Bright-glo
 Luciferase Assay System (Promega) according to the manufacturer's
 instructions.

20 For the cell growth analysis, the transfected cells were
 analyzed using Cell Counting Kit8 (Dojin) according to the
 manufacturer's instructions.

Results of the study are shown in Fig.2. Treatment of the transfected cells with TNF α induces NF- κ B-dependent luciferase expression. Compound E138 has an inhibitory effect on TNF α induced NF- κ B activation in a dose-dependent manner without affecting cell growth. In contrast to the effect of Compound E138, FK506 has no direct effect on TNF α induced NF- κ B activation at doses up to 3 nM (FK506 almost completely inhibits IL-2 mRNA expression in activated Jurkat cells at 1 nM). Therefore, HDAC inhibitor (Compound E138) has an inhibitory effect on NF- κ B activation induced by TNF α , a calcium-signaling-independent NF- κ B activation, whereas FK506 has no direct effect on it.

Test 4: Effect of HDAC inhibitor on MCP-1 production by activated THP-1 cells

For the measurement of MCP-1 level by ELISA, 1×10^6 THP-1 cells (JCRB0112, JCRB) were plated in 6-well tissue culture plates. The cells were cultured in RPMI1640 (SIGMA) supplemented with 10% FBS (MOREGATE) in the presence of PMA (SIGMA, 50 ng/mL) for 16 hours at 37°C, 5% CO₂. After incubation, the medium was changed to RPMI1640 supplemented with 2% FBS and various concentrations of Compound E138 or FK506 were added. The cells were further cultured for 9 hr and the amount of MCP-1 protein secreted by activated THP-1 cells into the medium was determined by ANALYZA Immuno assay System human MCP-1 (Genzyme Techne) according to the manufacturer's instructions.

For the cell growth analysis, 5×10^4 THP-1 cells were plated in 96-well tissue culture plates. The cells were cultured in RPMI1640 supplemented with 10% FBS in the presence of PMA (50 ng/mL) for 16 hours at 37°C, 5% CO₂. After incubation, the medium was changed to RPMI1640 supplemented with 2% FBS and various concentrations of Compound E138 or FK506 were added. The cells were further cultured for 9 hr and analyzed using Cell Counting Kit8 (Dojin) according to the manufacturer's instructions.

Results of the study are shown in Fig.3. Treatment of the cells with PMA induces MCP-1 expression. Compound E138 has an inhibitory effect on MCP-1 production by activated THP-1 cells in a dose-dependent manner without affecting cell growth. In contrast to the effect of Compound E138, FK506 has no direct effect on MCP-1

production by activated THP-1 cells at doses up to 1 nM (FK506 almost completely inhibits IL-2 mRNA expression in activated Jurkat cells at 1 nM).

These results demonstrate that HDAC inhibitors such as Compound
5 El38 is a new class of the immunosuppressive agents that inhibit MCP-1-dependent chronic inflammation.

To a solution of the Compound E138 (500 mg) in pyridine (1.2

ml) was added benzyl chloride (0.109 ml) under ice-cooling and the mixture was stirred for 5 hours under ambient temperature. To the reaction mixture was added an additional benzyl chloride (0.2 equivalent per Compound E138) and the mixture was stirred for 2 hours.

The mixture was stirred for 10 min, extracted with ethyl acetate, and the extract was washed with water, saturated aqueous sodium bicarbonate solution, water and saturated brine, and dried over sodium sulfate. The obtained crude compound was purified by column chromatography (eluting

Since the obtained Compound E162 included small amount of pyridine, the compound was dissolved into ethyl acetate, washed with 1N hydrochloric acid twice, then washed with saturated aqueous sodium bicarbonate solution, water and saturated brine, and dried over

15 sodium sulfate. The mixture was filtered and the filtrate was evaporated to give purified Compound E162.

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 12 and 23
because they relate to subject matter not required to be searched by this Authority, namely:
see FURTHER INFORMATION sheet PCT/ISA/210
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☒ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☒ No protest accompanied the payment of additional search fees.
